Humectants

What are simple and film-forming humectants?

Most gels contain humectants. Simple humectants such as glycerin, attract and bind water vapor from the surrounding air when it is abundant. This helps your hair to remain hydrated. Moisturized and hydrated hair has good elasticity, bounce, and definition. Simple humectants also prevent a hard hold gel from turning the hair dry and crusty. By taking water vapor from the air, simple humectants keep the dry gel in your hair hydrated and flexible.

Simple humectants work well when the humidity is just right. But under low humidity or low dew point conditions, these humectants can pull moisture from the hair. This is one reason why humectants such as glycerin can release water fairly readily and make the hair feel very dry in winter or dry climates. Conversely, in hot and high humidity climates, simple humectants can draw

moisture into the hair, raising the cuticle layer, and causing frizz. This is the main reason why many curlies living in hot and humid places (such as Florida) avoid glycerin in their styling products.

In contrast, film-forming humectants such as flax seed gel, okra gel, aloe vera, marshmallow root and carrageenan are large, complex molecules that form a film over the hair keeping moisture in to prevent the hair from dehydrating, or from pulling water vapor into the hair. What's amazing is that they work well in any weather! When a film-forming humectant forms a clear flexible film-seal over the hair, water inside the hair is blocked and has to pass through the film. This results in less water loss from the hair to the surrounding air, and conversely, prevents frizz-causing moisture from entering the hair.

What are protein humectants?

Other humectants often found in gels include proteins from plant and animal sources, which help slow water loss from the hair. Hydrolyzed proteins, peptides, and amino acids can get inside the hair shaft to moisturize from the inside whereas non-hydrolyzed proteins form clear films on top of the hair. Hydrolyzed proteins typically stay in the hair even when the hair is rinsed and thus can also be used in conditioners and deep conditioners. Larger proteins include keratin, collagen, and silk protein.

This Ultimate Guide contains **over 100 gels** currently on the market for natural hair. For each product, we have indicated if it contains protein, aloe, glycerin, or coconut.

All the gels in this guide are CG safe for natural hair. Manufacturers often change ingredients in formulas so be sure to double-check the ingredient list before you purchase.

How To Use This Guide

There is a lot of information in the guide - don't get overwhelmed. We have done the work for you. All you need to do is:

1 - Take our Hair Quiz.

2 - Read the short introduction in the guide.

3 - Review the icons at the top of the guide.

4 - Check the icons underneath each product.

5 - Match the icons with those at the top of the guide.

6 - Select those products that match your hair characteristics.

For example, if your hair is thin or thinning (low density) look for products that are marked for low density hair.

7 - If you are allergic to certain ingredients, such as aloe or coconut, avoid products with those icons.

8 - If your hair is limp or damaged, pick products with the protein icon.
